EDUCATION

Carnegie Mellon University - M.S. Electrical & Computer Engineering	Pittsburg, PA
GPA: 3.72/4.0	May 2023
University of California - B.S. Computer Science	Irvine, CA
GPA: 3.96/4.0 Summa Cum Laude	Dec 2020

SKILLS

- Generative AI & Agentic Architecture Design, Full-stack Development & Performance Tuning, Agile Development and Leadership

WORK EXPERIENCE

Volvo Cars	Gothenburg, Sweden
Global Graduate - Software Engineering Track	Aug 2023 - Dec 2025

- Developed an LLM-based multi-agent system featuring automated scoring and suggestion mechanisms, successfully reducing manual intervention in requirement document audits by **50%** while ensuring full compliance and consistency of functional requirements
- Spearheaded the development of an AI Agent for software testing workflow; implemented a structured chunking and Map-Reduce architecture to process DLT logs, compressing software troubleshooting time from an average of 5 hours to 40 minutes (an 89% reduction).
- Architected a brand website upgrade for the US region. Implemented dynamic route loading to reduce First Contentful Paint (FCP) by 35% and deployed a Content Delivery Network (CDN) to optimize Largest Contentful Paint (LCP) by 20%, resulting in a 12% decrease in bounce rate
- Led cross-functional teams in Shanghai as a Project Manager to deliver a Proof of Concept (PoC) for integrating Large Language Models (LLMs) with legacy automotive voice control systems. Designed a hybrid intent recognition framework that improved semantic accuracy to 82% in complex scenarios

Carnegie Mellon CyLab	Pittsburgh, PA
Research Assistant	May 2022 - Aug 2022

- Deployed vulnerability detection systems on GCP using PyTorch; Increased model performance by **19%** through hyper-parameter tuning and variable obfuscation

Glinsun AI	Wuhan, China
<i>Software Engineer</i>	May 2021 - Nov 2021

- Collaborated with 10 engineers to build a real-time physics engine for cloth simulation using C++ and CUDA; Implemented particle dynamics and **4** new features for the simulator to introduce complex object interactions: fluid, smoke, air-inflation effects, and two-way coupling
- Optimized simulator to reduce data duplication by **50%** through a unified particle model, maintaining a minimum of **60** frames per second when simulating millions of particles in parallel
- Developed deep learning based human body measurement system using semi-supervised learning with PyTorch. Achieved **87%** F1-score on dataset consisting of **6000** images
